

TODAY'S MECCANO

This year sees probably the biggest, most far-reaching modernisation plan for Meccano ever to be put into operation. In this feature the Editor describes the changes that have occurred and the reasons for them.

Shortly before Christmas, many U.K. modellers received an unexpected hint that great changes were coming to Meccano. The Company was featured in a nationwide T.V. programme – “The Risk Business” – and, though the programme did not cover fundamental system-changes in depth, it did show enough for the observant Meccanoman to deduce that significant developments were close at hand.

Those developments are here. Great changes are taking place; changes which we believe are good for the product; indeed, changes which might prove vital for the continuance of the Meccano system. It is recognised, however, that the people who will be most affected by the changes are existing Meccano users, with the accent on *users* – the enthusiasts who regard Meccano as a serious hobby medium; those who are genuinely interested in the product and in the company; those who, as part of their interest, read Meccano Magazine. The Company is, therefore, especially anxious to give readers, here, a full and frank

description of “Today’s Meccano”, with the background reasoning behind it.

BACKGROUND

It is a fact that complete sets account for the overwhelming majority of Meccano sales. It is also a fact that the overwhelming majority of sets are sold, not to enthusiasts, but to (or for) children, most of whom are not, nor ever will become as closely involved with, or as proficient at, model-building as the enthusiast. Indeed, most regard Meccano as a good toy.

This, of course, has no bearing on the non-toy, serious hobby capabilities of the system, but it does mean that it is the mass toy market which keeps the product in existence for the serious modeller. This, in turn, means that, if the product is to continue, the Company *must* cater for the mass market – and the mass market goes for sets.

During the past two years we have thoroughly researched Meccano – the product, the user, the dealer, in fact the whole market. This research revealed many areas of improvement:

THE SYSTEM: The various sets in the system were found to be far from ideal for today in terms of parts-selection and modelling capabilities. Minor contents changes over the years have been done more to accommodate new parts than to improve or up-date fundamental model-building scope. The quantities and selection of *types* of components in a set were remarkably similar to an equivalent set of maybe 40 years ago and thus the sort of model that could be built was in many cases limited to the same period. It is possible that the *original* selection of parts was not the best even for the time; it was certainly not the best for the more sophisticated styling of today.

THE MODELS. By this I mean the models featured in the Instructions Manuals. Because of traditionalistic thinking founded in the same earlier age that selected the set contents – and perhaps *because* of the set contents – the Manual models have tended (with exceptions of course) to fall far short of the best

Pictured at the top of this and the next page are examples of this year’s new Meccano Sets with their striking packaging. Below left, a Fork Lift Truck built with the new No. 5 Set. A solid, well-proportioned model, it features working steering and lifting stacker forks. Below right, the component parts of the Junior Power Drive Unit Mk. 2 (1½–4½ volt D.C. electric motor) which is contained in all the Standard Sets except the No. 1 Set. The motor is supplied in unassembled form for self-assembly: an extremely easy operation.

CRANE KIT TAKES OFF!

A working model from an Engineering Drawing by W.R.Hinson

"If you cannot photograph it, make a good working drawings of it". This is the sound editorial advice which Mr. Hinson of the Stevenage Meccano Club took when he designed this excellent working model Meccano Helicopter which can be built from the contents of the Crane Set. As a retired engineering draughtsman, our contributor has provided us with a first-class working drawing which we are pleased to reproduce here as an example of how the real engineer has to work from scale drawings. Each of the drawings are related in what is known as "First Angle Projection" which means that each view is 'projected' from

an adjacent view. For instance, view A is known as a side elevation because, if a person was standing at the side of the model, looking at it square on, this is the view he would see.

To obtain view B, known as the 'plan' view, the dimensions of A are simply carried down the drawing paper and the object is rotated through 90° to obtain the 'plan' and we now see the top view sometimes known as a 'bird's eye view'.

If details of the object are not fully revealed at this stage, an underview or 'under plan' is required and this is shown in view C. The reader should notice that a view from the nose of the helicopter is not given (such a view would be called an 'end elevation'), but all of the required information can be deducted from the first three views. Even at this stage, internal detail may be hidden so the fourth view, known as a

'sectional' view, is provided, in the case of the Meccano Helicopter, to show the internal drive arrangements of the Crane Set Motor. As the set does not possess a long Axle Rod, a compound shaft for the motor blades is made by joining up the two 2½" Rods by a 'coupling' made from a Fishplate locking a Collar to the boss of a 19t Pinion, the lower half of the Pinion bore being used as a 'sleeve' for the upper end of the lower 2½" Axle Rod.

Printed below is the full list of parts for the Crane Set numbers and standard Meccano part numbers (thanks to Mr. Hinson), the latter provided so that readers who do not own a Crane Kit may complete the model using standard parts, assuming, of course, that they possess them! The whole thing makes a change from written building instructions; we hope you like the presentation.

SCHEDULE OF PARTS

No. OFF	CRANE SET PART No.	STANDARD MECCANO PART No.
2	16a	16a
1	21	21
1	26c	26c
1	27d	27d
