

Among the Model-Builders

By "Spanner"

A Four-Wheel Steering Mechanism

In answer to many recent enquiries I am illustrating in Fig. 1 a simple type of four-wheel steering gear suitable for model vehicles of medium size. Many young model-builders are interested in four-wheel steering, and although this particular design

appeared in the *Meccano Magazine* some years ago this repeat description is sure to be of interest to younger model-builders who did not see the original.

The steering assemblies for the two sets of wheels are similar in construction, and in each case the axle beam consists of a 4 1/2 inch Strip 1 bolted to a Double Angle Strip fixed across the chassis. A 3/8 inch Bolt is passed through a 1 1/2 inch Strip 2 and a Double Bracket 3, and these parts are clamped tightly together by a nut. The Bolt is then passed through the axle beam and is fitted with lock-nuts so that it pivots freely. A similar assembly is fitted to the other end of the axle beam, but at this end a second 1 1/2 inch Strip 4 is held tightly on the 3/8 inch Bolt, at right-angles to the first 1 1/2 inch Strip. The free ends of the Strips 2 are lock-nutted to a Strip 5.

The ends of Strips 4 are linked by a 3 1/2 inch Strip 6, which is attached by lock-nutted bolts. A 3/8 inch Bolt is used at the front end of Strip 6, and a 2 inch Strip 7 is also pivoted on this Bolt. The Strip 7 is lock-nutted to an Angle Bracket 8, which in turn is lock-nutted to a Fishplate bolted tightly to a 1 1/2 inch Contrate 9.

The Contrate 9 is fixed on a Rod mounted across the chassis, and a Coupling 10 is slipped on it and held in place by a Collar. The Coupling forms the lower bearing for the steering column, which is fitted with a 1/2 inch Pinion that engages the Contra. The upper bearing for the steering column is a Fishplate bolted to an Angle Bracket fixed to a 1 1/2 inch Strip 11.

Automatic Gear Change Device

The mechanism shown in Fig. 2 is an Automatic Gear Change Device which operates when the input shaft changes its direction of rotation. It was devised by Mr. Ronald Wild, Wyke Regis, Weymouth,
